Capabilities

Environmental Data Management

Data Visualization and Cartography

Geostatistical Analysis

Mobile Field Data Collection

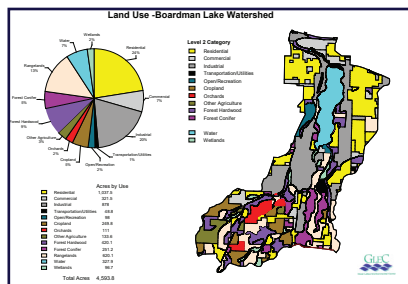

ESRI Story Map Development

Environmental Survey Support

Habitat and Species Mapping

Watershed Modeling

Utility Network Mapping

Clients

Federal Agencies

State Agencies

Counties and Municipalities

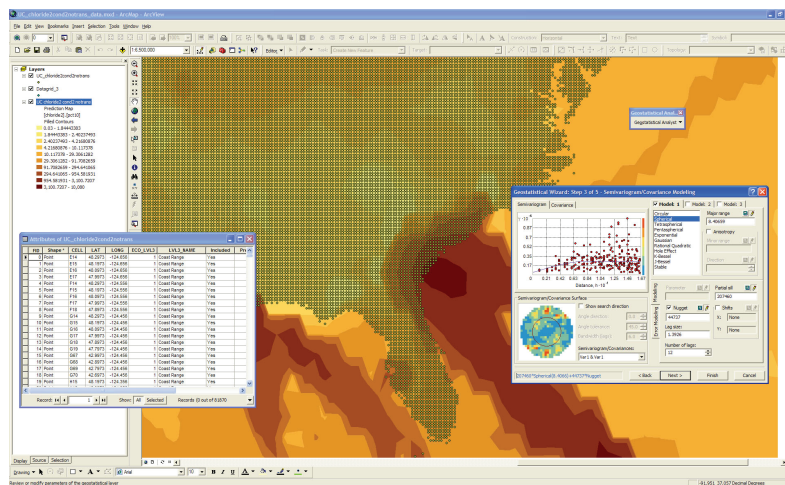

Conservation Organizations

Telecommunications Providers

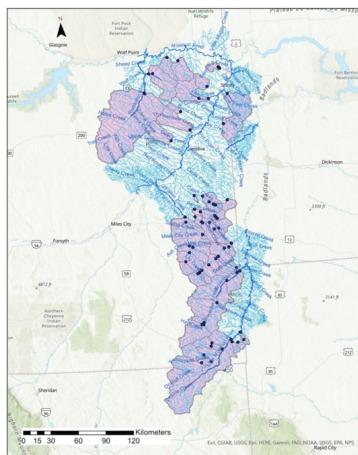

Power Generation Companies

Wastewater Utilities

The role of geographic information systems (GIS) in environmental problem-solving and communications continues to expand at a rapid pace. In the environmental sciences, virtually all critical data have a spatial component. Geographic information systems represent a series of processes and tools, whereby complex data are linked to earth-referenced features, manipulated through spatial analysis and database queries, and displayed as results in powerful multi-media maps. Managing and displaying data through GIS distills complex trends and relationships into accessible information.

GLEC's GIS clients receive innovative and cost-efficient solutions that stress maximum results with minimal complexity. We use the expanding wealth of public data and viewing tools to create meaningful and timely deliverables to support critical decision-making. GLEC GIS specialists utilize the latest versions of ESRI ArcGIS desktop and web-based application suites to provide a range of specialized GIS services, from map exhibits supporting environmental assessments to watershed modeling and analyses. GLEC's GIS practice is tightly integrated with our renowned expertise in environmental surveys/assessments, aquatic/terrestrial ecology, and environmental toxicology, lending further value to client GIS investments.
